

Day 2

TCP / IP Suite

- How data is transferred ?
- OSI → more theoretical way to explain
- TCP/IP → practical way (Internet, LAN).
- TCP / IP protocol suite is organized into four layers.

- 1] Application Layer → HTTP, HTTPS, DNS
- 2] Transport Layer → TCP, UDP, Port
- 3] ~~Network~~ Layer
 ↳ IP
- 4] Internet Layer. → IP
- 5] Link Layer. → MAC

How Internet work?

Internet - Interconnected Networks of computer around the world.

→ Router

1] - Modes of Communication

wired wireless

2] - If we want to connect 10 computer wired, we need many cables

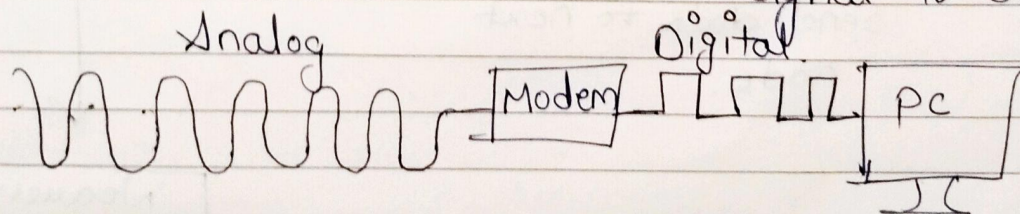

↓

To Reduce this we use Routers (act as a railway signal)

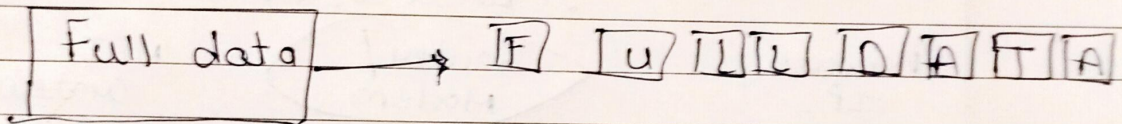

3] To Connect various Routers & Computers we need wire like telephone or Electricity But it has analog signal.

↓

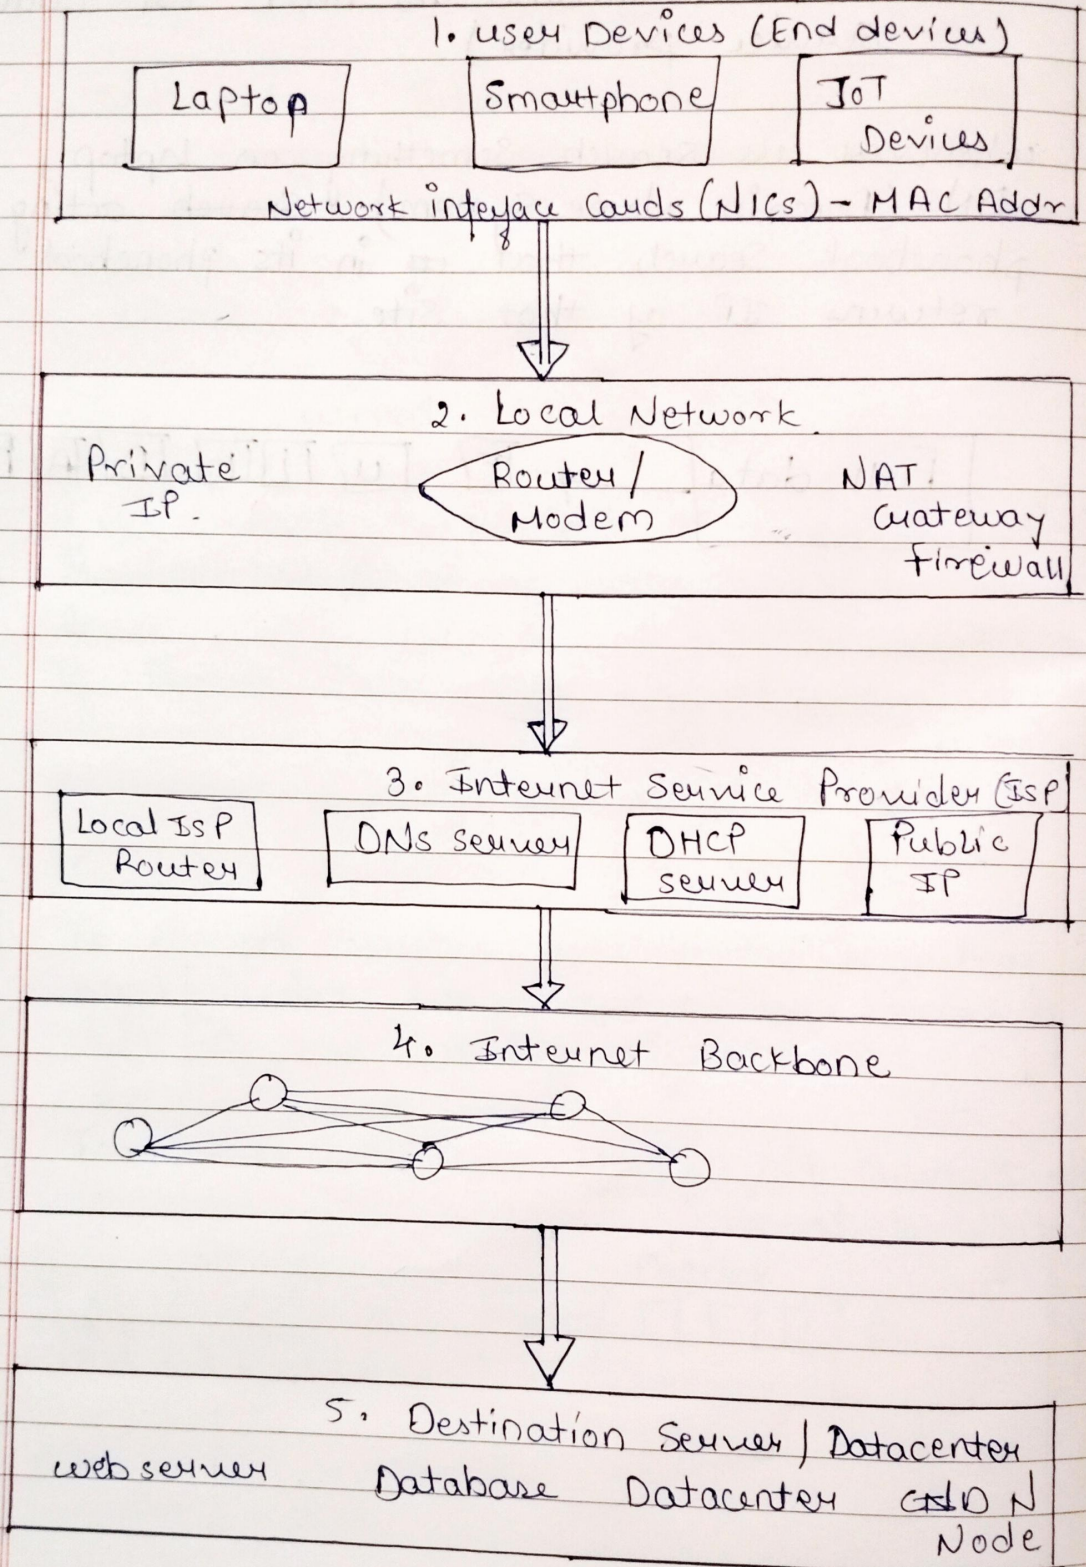

For this we use Modem (it converts Analog signal to Digital)

- 4] To connect to internet we need ISP (Internet Service Provider)
- 5] whenever we search something on laptop, DNS (Domain Name System) ~~search~~ acting as a phonebook search that ~~is~~ in its phonebook & returns IP of that site.

Internet Architecture

⇒ what happens when I Type www.google.com on my Laptop? (DNS)
